

Infertility Doctor Explains Why People Prefer Spain For IVF Treatment

Angela Jones September 15, 2014

ivf treatment in spain

In a recent interview, Dr Jon Aizpurua, director of fertility clinic IVF-Spain explained why so many Northern Europeans were today undergoing their IVF treatment in Spain, a country traditionally famous for sunshine and paella.

(Newswire.net -- September 15, 2014) Alicante, Alicante --

Director of fertility clinic IVF-Spain SL, Dr Jon Aizpurua says that the majority of their patients come from Britain, Germany, Switzerland, Austria, Russia and Holland, and most likely because their medical team speak their languages and are also familiar with the culture of these countries. He then said..."Language and culture are not a barrier when it comes to personalizing an IVF treatment at IVF-Spain."

With 200 over centers for reproductive medicine in Spain, I asked Dr Jon what made IVF-SPAIN so different, and he replied... "There are many reproductive medicine clinics across the country because Spain is a world leader in scientific investigation and the treatment of fertility disorders. At IVF SPAIN, our gestation success rate is much higher than other centers, due to our cutting edge technology, I+D+I and highly personalized treatments. Our patients receive personal attention and individual treatment, and this is what makes us different. Becoming parents is not always straightforward and many couples are disappointed when they are unable to start a family. At IVF Spain, we strive to

make their dreams come true, we achieve what seemed impossible!"

So I asked him exactly what he meant by personalized attention, and this is what he replied... "We are committed to providing personalized, individualized care, as we believe this is the key to successful reproduction. At IVF SPAIN, doctors take the time necessary to study all the information regarding the patient's infertility. Our medical team will look into the patient's full clinical history of reproduction and plan the treatment accordingly as a treatment designed exclusively for them alone. Our successful pregnancy rates are much higher than the national average. With a treatment of egg donation, gestation rates exceed 75% while the average in Spain is around 38%, according to the Spanish Society for Fertility."

I then asked him if he could attribute the technology used at **IVF-SPAIN for their high IVF success rates**, and he replied... "IVF-Spain offers its patients an expert professional medical team provided with modern equipment and the latest technology for assisted reproduction. Our laboratory is classed as a "Clean Room," where external materials such as floors and paintwork are toxin-free. Scientific investigation is in fact one of the three factors which give us higher pregnancy success rates. We have developed a new technique, vitrification of semen, and the first baby conceived by this method was born in July this year. We are currently working on projects concerning immunology and also those involving growth hormones. We aim to increase pregnancy in women who have a poor response to medication."

Spain has also been seen to provide the best diet for improving IVF success rates while undergoing "in vitro fertilization," thanks to omega-3 oil found in Mediterranean fish, and surely the sun and paella are other good reasons why couples chose Spain to undergo IVF treatment. Dr Jon Aizpurua is the director of IVF-Spain and a worldwide renowned specialist in the field of Assisted Reproductive Treatments. For couples considering IVF Treatment in Spain, **a free online IVF test is offered by IVF-Spain on their official website.**
